There are various mathematical descriptions of the electromagnetic field that are used in the study of electromagnetism, one of the four fundamental interactions of nature. In this article, several approaches are discussed, although the equations are in terms of electric and magnetic fields, potentials, and charges with currents, generally speaking.

In electrodynamics, the retarded potentials are the electromagnetic potentials for the electromagnetic field generated by time-varying electric current or charge distributions in the past. The fields propagate at the speed of light c , so the delay of the fields connecting cause and effect at earlier and later times is an important factor: the signal takes a finite time to propagate from a ...

The simplest of these is the Laplace equation from classical electrodynamics, which appears as Gauss's law: $\nabla^2 V = -\rho/\epsilon_0$. $\nabla^2 V = -\frac{\rho}{\epsilon_0}$. $\nabla^2 V = -\epsilon_0 \rho$. The general solution for the electric potential V can be expanded in a basis of spherical harmonics as
